

*Planetary Mission Entry Vehicles*  
*Quick Reference Guide*  
Version 3.0

*This is Version 3.0 of the planetary mission entry vehicle document. Three new missions, Re-entry F, Hayabusa, and ARD have been added to the previously published edition (Version 2.1). In addition, the Huygens mission has been significantly updated and some Apollo data corrected.*

*Due to the changing nature of planetary vehicles during the design, manufacture and mission phases, and to the variables involved in measurement and computation, please be aware that the data provided herein cannot be guaranteed. Contact Carol Davies at [cdavies@mail.arc.nasa.gov](mailto:cdavies@mail.arc.nasa.gov) to correct or update the current data, or to suggest other missions. All contacts are welcome.*

### APPENDIX III: UNIT CONVERSION FACTORS

## DEFINITIONS CONTINUED

### Trim $L/D$

The  $L/D$  where vehicle is statically stable. The vehicle will trim (restore) to trim angle of attack if variations occur.

### Ballistic coefficient

The ratio of the product of drag coefficient ( $C_d$ ) and projected reference area ( $A$ ) to mass ( $m$ ), giving  $m/C_d A$ .

### Stagnation heating rate

The maximum convective heat flux at the stagnation point. Depends on trajectory. The stagnation point is where the velocity to the surface adiabatically comes to zero. Location depends on angle of attack and deviation behind the shock. The stagnation point is often where the maximum heating rate occurs, but not always.

### Integrated heat load

The convective heat flux integrated over flight time. The highest heat load is usually, but not always, at the stagnation point. The integrated heat load will vary over the vehicle surface.

### Radiative heat flux at stagnation point

This is the heat flux radiated from the shock layer to the surface. It may or may not be a maximum at the stagnation point.

### Peak heat stagnation pressure

The pressure at the time of maximum convective heat flux. This is not the peak pressure, which occurs later in the trajectory.

### Material designation

This can be a material trade name, defined by the manufacturer (e.g., SLA-561IV) or a generic designator applied to a class of materials (e.g., carbon phenolic). It provides little useful information about the material other than a broad description of its constituents.

### Thickness

This is “as manufactured” thickness of the material, usually specified at the stagnation point. Useful for a TPS of uniform thickness; less useful for a “tailored” TPS. The “as manufactured” thickness includes the “nominal design thickness” to which additional thickness is added (margin) to accommodate uncertainties in the entry environment and/or material performance.

### Resin material

This is the “organic matrix” (e.g., epoxy, silicone, phenolic) in an organic matrix composite wherein the matrix (glue) fills the voids and provides rigidity to the structural reinforcement (e.g., fibers, fabric, honeycomb). The organic resin will pyrolyze when heated, typically leaving a carbonaceous residue (char).

### Matrix material

Analogous to a resin material in primary function, the matrix is typically stable and will not pyrolyze when heated. Examples include inorganic ceramics (e.g., glass, alumina) in ceramic matrix composites and carbon in carbon-carbon composites.

## APPENDIX II: DEFINITIONS

### **Entry angle, $\gamma$**

The angle between the local horizontal plane (orthogonal to the vector from the planet center to the vehicle) and the velocity vector of the vehicle,  $V$ , at a reference altitude,  $h$ . The entry angle can be inertial or relative, depending on entry velocity used.  $\gamma$  is negative when  $V$  is below the horizontal plane, as in planetary entry.

### **Inertial entry velocity**

The vehicle velocity at reference altitude,  $h$ , assuming a non-rotating planet.

### **Relative entry velocity**

The inertial entry velocity amended by the component of the planet's rotation, assuming the atmosphere to be a solid body.

### **Velocity at peak heat**

The velocity when the vehicle reaches the maximum convective heat flux at the stagnation point.

### **Control method**

- (a) Ballistic: no control, subject to drag forces only, with passive stability about zero lift condition;
- (b) Controlled Ballistic: active control to maintain zero lift; and
- (c) RCS: a set of small engines called the reaction control system (RCS) engines.

### **Center of gravity,**

In the table, the value of  $X_{CG}/D$  is given, where  $D$  is the maximum diameter of the vehicle. On the diagram, the actual  $X_{CG}$  is shown. Most CG are not exactly on the centerline because of manufacturing tolerances, but generally the  $Y$  value wasn't given or it is so close that it doesn't show up in the diagram. The exceptions were Apollo command modules and the Viking landers, where the  $Y$  offset was deliberate to achieve the desired angles of attack.

### **Shape**

All vehicles are spherically blunted cones, or spherical, or conical.

### **Nose radius**

The radius of the spherical nose, or the capsule radius.

### **Base area**

The base area projected along the centerline.

### **Vehicle mass**

The total vehicle mass of the vehicle at entry, including TPS and payload. Generally, the vehicle mass at entry is the same as take-off mass minus any fuel used for maneuvering. However, the mass can change after leaving the orbiter but before entry. An example is the small probe of Pioneer Venus where the spin yo-yo was jettisoned before entry. The mass can also change during entry if the heat shield material ablates. An (extreme) example was the Galileo probe that lost about 26% of its entry mass to ablation.

### **TPS mass fraction**

The proportion of TPS mass to vehicle mass at entry. Insulator may or may not be included.

### **Payload mass**

The proportion of payload mass (scientific instruments and may include transmitters, batteries etc.) to vehicle mass.

LAUNCH: **MAY 22, 1965**  
ENTRY: **MAY 22, 1965**

MISSION DESCRIPTION:  
*Technology demonstrator for  
Apollo re-entry heating environment*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-14.7°	Shape	66° sphere-cone	Trim L/D (specify trim $\alpha$ )	0 at 0°	Material designation	Beryllium (fore) Phenolic asbestos (aft)
Inertial entry velocity		Nose radius (3 parts)	.935 m .805 m .702 m	Ballistic coeff.	F(t)	Thickness	.3 cm (fore)
Relative entry velocity	11.35 km/s	Base area	.354 m <sup>2</sup> .312 m <sup>2</sup> .272 m <sup>2</sup>	Stagnation heating rate	1140 W/cm <sup>2</sup>	Ablating? Ejected?	Fore: 3 ejected. Aft: ablating
Velocity at peak heat	10.0 km/s	Vehicle mass	86.5 kg	Integrated heat load		Resin mat. Matrix mat.	
Control method	Ballistic	TPS mass fraction, inc. insul.		Radiative heat flux	~350 W/cm <sup>2</sup> (.2-.4 $\mu$ ) implying ~650 total	Resin dens. Matrix dens.	
Center of Gravity, $X_{CG}/D$		Payload mass		PH stag. pressure	1.046 atm	Total material density	

**INSTRUMENTATION:**

- Three forebody calorimeters, 11 forebody thermocouples, 12 offset radiometer thermocouples and one static pressure transducer on the afterbody

**NOTES:**

- This aerothermal flight test was to evaluate radiative heating for Apollo.
- The reentry package consisted of three separate heat shield/calorimeter combinations, therefore the mass and OML changed with time.

MISSION: **APOLLO AS-201**  
 PLANET: **EARTH**

LAUNCH: FEB 26, 1966  
 ENTRY: FEB 26, 1966

MISSION DESCRIPTION:  
*First unmanned suborbital flight to test the Saturn 1B launch vehicle, and the command and service modules*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-8.58° inertial, -9.03° relative	Shape	Capsule: 33° cone	Trim L/D (specify trim $\alpha$ )	-19.7° < $\alpha$ < 21.3°	Material designation	Avco 5026-39 HC
Inertial entry velocity		Nose radius	4.69 m, 3 m effective	Ballistic coeff.		Thickness	See note
Relative entry velocity	7.67 km/s	Base area	12.02 m <sup>2</sup>	Stagnation heating rate	186 W/cm <sup>2</sup> at peak	Ablating? Ejected?	No
Velocity at peak heat	5.73 km/s	Vehicle mass		Integrated heat load	7,600 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Epoxy-novolac +phenolic microballoon
Control method	No control: Rolled	TPS mass fraction, inc. insul.	13.7%	Radiative heat flux	0.00	Resin dens. Matrix density	244.6 kg/m <sup>3</sup>
Center of Gravity, $X_{CG/D}$	.27	Payload mass	None	PH stag. pressure	0.85 atm	Total material density	Ablator: 544.6 kg/m <sup>3</sup>

INSTRUMENTATION:

• 36 pressure sensors all worked OK, 35 calorimeters worked initially

NOTES:

- TPS thickness: Ablator = 4.32 cm, braised stainless steel substructure (PH 15-7 MO) = 5.08 cm
- Insulation: (TG-15,000) = 2.03 cm, aluminum honeycomb (2014-T6 and 5052-H39) = 3.81 cm
- Peak heating is not at stagnation point
- Manufacturer: AVCO Corp

MISSION DESCRIPTION:

Second unmanned suborbital flight to test the Saturn 1B launch vehicle, and the command and service modules

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-3.53° relative	Shape	Capsule: 33° cone	Trim L/D (specify trim $\alpha$ )	0.28° < L/D < 0.33° $\alpha=21^\circ \pm 3$	Material designation	Avco 5026-39 HC/G
Inertial entry velocity		Nose radius	4.69 m, 3 m effective	Ballistic coeff.		Thickness	See note
Relative entry velocity	8.29 km/s	Base area	12.02 m <sup>2</sup>	Stagnation heating rate	107 W/cm <sup>2</sup> at peak	Ablating? Ejected?	No
Velocity at peak heat	7.77 km/s	Vehicle mass		Integrated heat load	24,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Epoxy-novolac Quartz fiber +phenolic microballoon
Control method	Roll modulation	TPS mass fraction, inc. insul.	13.7%	Radiative heat flux	0.00	Resin dens. Matrix density	244.6 kg/m <sup>3</sup> 300 kg/m <sup>3</sup>
Center of Gravity, X <sub>CG</sub> /D	.27	Payload mass	None	PH stag. pressure	0.11 atm	Total material density	Ablator: 544.6 kg/m <sup>3</sup>

INSTRUMENTATION:  
• 36 pressure sensors all worked OK, 35 calorimeters worked initially

NOTES:

- TPS thickness: Ablator = 4.32 cm, braised stainless steel substrate (PH 15-7 MO) = 5.08 cm
- Insulation: (TG-15,000) = 2.03 cm, aluminum honeycomb (2014-T6 and 5052-H139) = 3.81 cm
- Manufacturer: AVCO Corp

MISSION: **APOLLO 4**  
PLANET: **EARTH**

LAUNCH: **NOV 9, 1967**  
ENTRY: **NOV 9, 1967**

MISSION DESCRIPTION:  
*Test of Saturn V launch vehicle and overall re-entry operations*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-6.92° inertial, -7.13° relative	Shape	Capsule: 33° cone	Trim L/D (specify trim α)	0.37° < L/D < 0.44	Material designation	Avco 5026-39 HC/G
Inertial entry velocity	11.14 km/s	Nose radius	4.69 m, 3 m effective	Ballistic coeff.	395.8 kg/m <sup>2</sup>	Thickness	See note
Relative entry velocity	10.73 km/s	Base area	12.02 m <sup>2</sup>	Stagnation heating rate	490 W/cm <sup>2</sup> at peak	Ablating? Ejected?	No
Velocity at peak heat	10.25 km/s	Vehicle mass	5424.9 kg	Integrated heat load	43,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Epoxy-novolac Quartz fiber +phenolic microballoon
Control method	Roll modulation	TPS mass fraction, inc. insul.		Radiative heat flux	115-264 W/cm <sup>2</sup>	Resin dens. Matrix density	244.6 kg/m <sup>3</sup> 300 kg/m <sup>3</sup>
Center of Gravity, X <sub>CG</sub> /D	.27	Payload mass	None	PH stag. pressure	0.35 atm	Total material density	Ablator: 544.6 kg/m <sup>3</sup>

**INSTRUMENTATION:**

• 17 pressure sensors all worked and 23 calorimeters worked initially. Radiometer functioned well.

**NOTES:**

- TPS thickness: Ablator = 4.32 cm, braised stainless steel substructure (PH 15-7 MO) = 5.08 cm
- Insulation: (TG-15,000) = 2.03 cm, aluminum honeycomb (2014-T6 and 5052-H39) = 3.81 cm
- Manufacturer: AVCO Corp

01/06/98	Lunar Prospector	Moon	Lunar orbital mapper

MISSION: **APOLLO 6**

PLANET: **EARTH**

LAUNCH: **APR 4, 1968**

ENTRY: **APR 4, 1968**

MISSION DESCRIPTION:

*Final qualification test for launch vehicle and command module for manned mission*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-5.9° inertial	Shape	Capsule: 33° cone	Trim L/D (specify trim $\alpha$ )	0.35° < L/D < 0.4	Material designation	Avco 5026-39 HC/G
Inertial entry velocity	10.00 km/s	Nose radius	4.69 m, 3 m effective	Ballistic coeff.	395.8 kg/m <sup>2</sup>	Thickness	See note
Relative entry velocity	9.60 km/s	Base area	12.02 m <sup>2</sup>	Stagnation heating rate	240 W/cm <sup>2</sup> at peak	Ablating? Ejected?	No
Velocity at peak heat	8.32 km/s	Vehicle mass	5424.9 kg	Integrated heat load	32,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Epoxy-novolac Quartz fiber +phenolic microballoon
Control method	Roll modulation	TPS mass fraction, inc. insul.	13.7%	Radiative heat flux	43 W/cm <sup>2</sup>	Resin dens. Matrix density	244.6 kg/m <sup>3</sup> 300 kg/m <sup>3</sup>
Center of Gravity, X <sub>CGD</sub>	.27	Payload mass	None	PH stag. pressure	0.354 atm	Total material density	Ablator: 544.6 kg/m <sup>3</sup>

INSTRUMENTATION:

NOTES:

- TPS thickness: Ablator = 4.32 cm, braised stainless steel substructure (PH 15-7 MO) = 5.08 cm
- Insulation: (TG-15,000) = 2.03 cm, aluminum honeycomb (2014-T6 and 5052-H39) = 3.81 cm
- Manufacturer: AVCO Corp

MISSION: **REENTRY F**

PLANET: **EARTH**

LAUNCH: **APR 27, 1968**

ENTRY:

MISSION DESCRIPTION:

*To measure turbulent heating rates and transition onset in a flight environment*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-20.78°	Shape	5° half cone, 3.962 m long	Trim L/D (specify trim $\alpha$ )	0° ballistic	Material designation	Nosetip: ATJ graphite Body: beryllium
Inertial entry velocity	6.28 km/s	Nose radius	.254 cm	Ballistic coeff.	~50,000 kg/m <sup>2</sup>	Thickness	Be: 1.524 cm
Relative entry velocity	5.96 km/s	Base area	0.3772 m <sup>2</sup>	Stagnation heating rate	32 W/cm <sup>2</sup>	Ablating? Ejected?	Nosetip: Yes No
Velocity at peak heat	5.47 km/s	Vehicle mass	272 kg	Integrated heat load		Resin mat. Matrix mat.	
Control method	None	TPS mass fraction, inc. insul.		Radiative heat flux	~0 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>CGD</sub>		Payload mass		PH stag. pressure	250 atm See note	Total material density	

INSTRUMENTATION:

- Multiple thermocouples and pressure sensors at 21 stations on cone, 4 heat-flux gauges and 2 pressure gauges on base.
- 3 thermocouples in nose-tip assembly

NOTES:

- Nose-tip heating rate is not relevant for this flight, which was designed to measure heating on a sharp cone.
- The nose tip was meant to ablate during entry.
- The beryllium heat shield melted about 40 seconds after entry.

08/01/67	Lunar Orbiter 5	Moon	Lunar orbit

MISSION: **PAET**  
 PLANET: **EARTH**

LAUNCH: **JUN 2, 1971**  
 ENTRY: **JUN 2, 1971**

MISSION DESCRIPTION:

*To test the capability to determine the composition of unknown atmospheres during high-speed entry*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Relative at 90 km: -40.8°	Shape	Blunt-nosed, 55° half-cone angle	Trim L/D (specify trim $\alpha$ )	Material designation	See note	
Inertial entry velocity	6.60 km/s	Nose radius	0.46 m	Ballistic coeff.	Thickness	Nose: 1-2.5 cm Conical frustum: 0.76 cm	
Relative entry velocity	6.56 km/s	Base area	.66 m <sup>2</sup>	Stagnation heating rate	Ablating? Ejected?	Yes: Frustrium No	
Velocity at peak heat	5.6 km/s	Vehicle mass	62.1 kg	Integrated heat load	Resin mat. Matrix mat.	Silicone	
Control method	Ballistic	TPS mass fraction, inc. insul.	Forebody: 13.7% Afterbody: 3.5%	Radiative heat flux	Resin dens. Matrix density		
Center of Gravity, $X_{CG}/D$	.202	Payload mass	14 kg	PH stag. pressure	Total material density	Beryllium: 1858 kg/m <sup>3</sup> Ablator: 450 kg/m <sup>3</sup>	

**INSTRUMENTATION:**

- Forebody: 2 beryllium heat transfer gauges, 2 heat shield plugs in the ablator and pressure gauge in beryllium cap
- Afterbody: Thermocouple in low-density ablator (SLA-220) located slightly aft of shoulder

**NOTES:**

- Nose: Beryllium heatsink
- Conical frustum: ESA 3560 ablator

Data Collected by: M. Tauber

MISSION: **VIKING LANDER 1**  
PLANET: **MARS**

LAUNCH: **AUG 20, 1975**  
ENTRY: **JUL 20, 1976**

MISSION DESCRIPTION:

*To characterize the structure and composition of the atmosphere and surface of Mars*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial -16.99°	Shape	70° sphere-cone	Trim L/D (specify trim $\alpha$ )	$\alpha = -11.1^\circ$	Material designation	SLA561-V
Inertial entry velocity	4.61 km/s	Nose radius	0.88 m	Ballistic coeff.	At peak heat flux: 63.0 kg/m <sup>2</sup>	Thickness	Variable: max 1.38 cm
Relative entry velocity	4.42 km/s	Base area	9.65 m <sup>2</sup>	Stagnation heating rate	Peak: 21.02 W/cm <sup>2</sup>	Ablating? Ejected?	Ablating
Velocity at peak heat	4.02 km/s	Vehicle mass	980 kg	Integrated heat load	~1100 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Resin
Control method, e.g. flap deflect.	3-axis RCS	TPS mass fraction, inc. insul.	2.8%	Radiative heat flux	0	Resin dens. Matrix dens.	185 kg/m <sup>3</sup> 48 kg/m <sup>3</sup>
Center of Gravity, X <sub>CG</sub> /D	.219 (Ref. 3)	Payload mass		PH stag. Pressure	.06 atm	Total material density	233 kg/m <sup>3</sup>

INSTRUMENTATION:

- The forebody aeroshell was not instrumented, but the wake enclosure (backshell) had thermocouples.
- There was one pressure port off stagnation point and one on the base cover.
- Temperature gauges were on the back face and on both back-shell frustums.

NOTES:

- Resin Material: silicone elastomer with glass microspheres and cork
- Matrix material: fiberglass-phenolic honeycomb
- RCS was used to maintain trim angle of attack

MISSION: **MARS EXPLORATION ROVERS**  
“Spirit” and “Opportunity”  
PLANET: **MARS**

LAUNCH: **JUN 10, 2003 & JUL 7, 2003**  
ENTRY: **JAN 3, 2004 & JAN 24, 2004**

MISSION DESCRIPTION:

*To place two rovers (A and B) on Mars to conduct remote geological investigations including search for past water activity*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-11.5° @ 125 km	Shape	70° sphere-cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	SLA-561V (SLA-561S for backshell)
Inertial entry velocity		Nose radius	0.66 m	Ballistic coeff.	88 kg/m <sup>2</sup>	Thickness	1.57 cm
Relative entry velocity	5.55 km/s	Base area	5.52 m <sup>2</sup>	Stagnation heating rate	44 W/cm <sup>2</sup>	Ablating? Ejected?	Yes
Velocity at peak heat	4.93 km/s	Vehicle mass	836 kg	Integrated heat load	3687 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Resin
Control method	Ballistic	TPS mass fraction, inc. insul.	3.6% fore body; 2% back shell	Radiative heat flux	~0	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	0.30	Payload mass		PH stag. pressure	0.06 atm	Total material density	256 kg/m <sup>3</sup>

INSTRUMENTATION:

- MER A and MER B are two separate missions, each carrying a rover to Mars. Data here are for MER B, the most severe entry environment.
- This mission uses an entry aeroshell similar to that of Pathfinder, however the enclosed rovers are larger than Sojourner and are self-contained.
- There are 3 TIRS (Transverse Impulse Rocket System) covers made of SIRCA spaced around the backshell.

MISSION: **BEAGLE 2**  
PLANET: **MARS**

LAUNCH: JUN 2, 2003  
ENTRY: DEC 25, 2003

MISSION DESCRIPTION:

*To develop a low-cost low-mass system for placing an exobiology science payload on Mars*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial: -15.8°	Shape	60° sphere-cone	Trim L/D (specify trim $\alpha$ )	Ballistic (2° average)	Material designation	Norcoat-Liege (EADS)
Inertial entry velocity	5.63 km/s	Nose radius	0.417 m	Ballistic coeff.	At peak heat flux: 69.9 kg/m <sup>2</sup>	Thickness	8mm
Relative entry velocity	5.40 km/s	Base area	0.67 m <sup>2</sup>	Stagnation heating rate	72.28 W/cm <sup>2</sup>	Ablating? Ejected?	Yes Yes
Velocity at peak heat	Relative: 4.70 km/s	Vehicle mass	At entry: 68.46 kg	Integrated heat load	2449 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Phenolic Cork
Control method	Ballistic	TPS mass fraction, inc. insul.	9.2% fore body; 15.2% back shell	Radiative heat flux	0.17 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>cg</sub> /D	0.26	Payload mass	11.4 kg (science) (33.2 kg landed)	PH stag. pressure	0.18 atm	Total material density	460 kg/m <sup>3</sup>

INSTRUMENTATION:

- No TPS instrumentation: axial accelerometers only

NOTES:

- Image (all rights reserved Beagle 2) is an impression of Beagle 2 post separation from Mars Express.
- Beagle 2 landed on Mars but did not make radio contact.

MISSION: **VIKING LANDER 2**  
PLANET: **MARS**

LAUNCH: SEP 9, 1975  
ENTRY: SEP 3, 1976

MISSION DESCRIPTION:

*To characterize the structure and composition of the atmosphere and surface of Mars*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial: (at 138 km) -17.08°	Shape	Blunt-nosed 70° half cone	Trim L/D (specify trim $\alpha$ )	0.18 at $\alpha = -11.3^\circ$	Material designation	SLA-561V
Inertial entry velocity	4.74 km/s	Nose radius	0.88 m	Ballistic coeff.	63.6 kg/m <sup>2</sup>	Thickness	Variable: max 1.38 cm
Relative entry velocity	(at 244 km) 4.48 km/s	Base area	9.65 m <sup>2</sup>	Stagnation heating rate	(max) 21.4 W/cm <sup>2</sup>	Ablating? Ejected?	Ablator-pyrolyzed Ejected:yes
Velocity at peak heat	4.0 km/s	Vehicle mass	981.5 kg	Integrated heat load (stag pt)	Approx. 1050 J/cm <sup>2</sup>	Resin mat. Matrix mat.	See notes
Control method, e.g. flap deflect.	Active-reaction control	TPS mass fraction, inc. insul.	2.8%	Radiative heat flux	0	Resin dens. Matrix dens.	183.0 kg/m <sup>3</sup> 48.0 kg/m <sup>3</sup>
Center of Gravity, X <sub>cg</sub> /D	.219	Payload mass		PH stag. Pressure	0.063 atm	Total material density	

INSTRUMENTATION:

- The forebody aeroshell was not instrumented, but the wake enclosure (backshell) had thermocouples.
- There was one pressure port off stagnation point and one on the base cover.
- Temperature gauges were on the back face and on both back-shell frustums.

NOTES:

- Resin Material: silicone elastomer with glass microspheres and cork
- Matrix material: fiberglass-phenolic honeycomb
- RCS was used to maintain trim angle of attack

MISSION: **PIONEER-VENUS**  
**SMALL "NORTH PROBE"**  
 PLANET: **VENUS**

LAUNCH: **AUG 8, 1978**  
 ENTRY: **DEC 9, 1978**

MISSION DESCRIPTION:

*A 60° N day entry to map atmosphere, including characterizing wind and turbulence*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-68.7° at 200 km	Shape	Blunt-nosed, 45° half-cone angle	Trim L/D (specify trim $\alpha$ )	0	Material designation	Carbon-phenolic
Inertial entry velocity	11.54 km/s	Nose radius	0.19 m	Ballistic coeff.	190 kg/m <sup>2</sup>	Thickness	1.2 cm at stagnation point
Relative entry velocity	Same	Base area	0.46 m <sup>2</sup>	Stagnation heating rate	7200 W/cm <sup>2</sup>	Ablating? Ejected?	Yes No
Velocity at peak heat	10.50 km/s	Vehicle mass	91 kg	Integrated heat load	At stag. pt. 11,700 J/cm <sup>2</sup>	Resin mat. Matrix mat.	89.8% Carbon 2.8% Hydrogen 6.9% Oxygen
Control method	Ballistic	TPS mass fraction, inc. insul.	12.9%	Radiative heat flux	@ max heat 3400 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	0.40	Payload mass	3.60 kg	PH stag. pressure	6.40 atm	Total material density	1490 kg/m <sup>3</sup>

INSTRUMENTATION:

- Thermocouples: one at 17° off stagnation point (0.41 cm below heat-shield surface); another on conical frustum ahead of shoulder (0.30 cm below heat-shield surface) at  $s/R_n = 2.2$

NOTES:

- Heating rates and loads are probably for non-ablating conditions.

MISSION: **HAYABUSA**  
 PLANET: **EARTH RETURN**

LAUNCH: **MAY 9, 2003**  
 ENTRY: **JUN 2007**

MISSION DESCRIPTION:

*To collect samples from asteroid Itokawa (1998SF36) and return to Earth*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-13.8°	Shape	45° sphere-cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	Carbon-phenolic
Inertial entry velocity	11.7 km/s	Nose radius	.202 m	Ballistic coeff.	113.5 kg/m <sup>3</sup>	Thickness	3.0 cm
Relative entry velocity	11.3 km/s	Base area	.128 m <sup>2</sup>	Stagnation heating rate	1500 W/cm <sup>2</sup>	Ablating? Ejected?	Yes Yes
Velocity at peak heat	10.2 km/s	Vehicle mass	16.27 kg	Integrated heat load	32,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	
Control method	none	TPS mass fraction, inc. insul.	43%	Radiative heat flux	300 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	0.28	Payload mass	1.04 kg	PH stag. pressure	0.61 atm	Total material density	1400 kg/m <sup>3</sup>

INSTRUMENTATION:

- A one-axis accelerometer for parachute deployment.

NOTES:

- The mission name was changed from MUSES-C

REFERENCES:

MISSION: **GENESIS**  
 PLANET: **EARTH RETURN**

LAUNCH: AUG 8, 2001  
 ENTRY: SEP 8, 2004

MISSION DESCRIPTION:

*To collect solar wind particles and return to Earth*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-8°	Shape	59.81° blunt cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	Fore: Carbon-carbon Aft: SLA-561V
Inertial entry velocity	11.0 km/s	Nose radius	.43 m	Ballistic coeff.	80 kg/m <sup>3</sup>	Thickness	6 cm
Relative entry velocity	10.8 km/s	Base area	1.78 m <sup>2</sup>	Stagnation heating rate	700 W/cm <sup>2</sup>	Ablating? Ejected?	Partially No
Velocity at peak heat	9.2 km/s	Vehicle mass	210 kg	Integrated heat load	16,600 J/cm <sup>2</sup>	Resin mat. Matrix mat.	
Control method	Spin-stabilized aero-ballistic	TPS mass fraction, inc. insul.	~18%	Radiative heat flux	30 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, $X_{CG}/D$	.33	Payload mass		PH stag. pressure		Total material density	

INSTRUMENTATION:

- Thermosensitive paint strips

NOTES:

- The capsule crashed violently into the desert after failing to deploy the drag devices.
- Despite this mishap, many of the collectors remained intact and most of the mission goals should be accomplished.

MISSION: **STARDUST**  
 PLANET: **EARTH RETURN**

LAUNCH: **FEB 7, 1999**  
 ENTRY: **JAN 15, 2006**

MISSION DESCRIPTION:  
*To collect comet material from Wild 2 and return to Earth*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-8.2° ± 0.08° @ 125 km	Shape	Blunt-nosed 60° half-angle cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	PICA-15
Inertial entry velocity	12.8 km/s @ 125 km	Nose radius	0.23 m initial	Ballistic coeff (Ablated).	60.0 kg/m <sup>2</sup> 60.4 kg/m <sup>2</sup>	Thickness	5.82 cm
Relative entry velocity	12.6 km/s @ 125 km	Base area (Ablated)	0.52 m <sup>2</sup> 0.50 m <sup>2</sup>	Stagnation heating rate	(non-ablating) 1200 W/cm <sup>2</sup>	Ablating? Ejected?	Yes No
Velocity at peak heat	11.1 km/s	Vehicle mass	45.8 kg	Integrated heat load	36,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Phenolic Carbon fiber
Control method	Ballistic	TPS mass fraction, inc. insul.	22%	Radiative heat flux	130 W/cm <sup>2</sup>	Resin dens. Matrix density	109 kg/m <sup>3</sup> 160 kg/m <sup>3</sup>
Center of Gravity, $X_{CG/D}$	.35	Payload mass		PH stag. pressure	0.275 atm	Total material density	250 kg/m <sup>3</sup> approx.

INSTRUMENTATION:

NOTES:

- The rendezvous with Wild 2 occurred on Jan 2, 2004.
- The Stardust capsule made a successful return to Earth on Jan 15, 2006.

MISSION: **DEEP SPACE 2**  
PLANET: **MARS**

LAUNCH: JAN 3, 1999  
ENTRY: DEC 3, 1999

MISSION DESCRIPTION:

*To penetrate the Martian surface with two small probes*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial -13.25° at 128 km	Shape	45° sphere- cone, spherical aft	Trim L/D (specify trim $\alpha$ )	0	Material designation	Sireca-SPLIT
Inertial entry velocity	6.9 km/s	Nose radius	.0875 m	Ballistic coeff.	36.2 kg/m <sup>2</sup>	Thickness	~1cm
Relative entry velocity	6.9 km/s	Base area	.096 m <sup>2</sup>	Stagnation heating rate	194 W/cm <sup>2</sup>	Ablating? Ejected?	Not ejected
Velocity at peak heat	5.94 km/s	Vehicle mass	3.67 kg	Integrated heat load	8712 J/cm <sup>2</sup>	Resin mat. Matrix mat.	
Control method	Ballistic	TPS mass fraction, inc. <i>insul.</i>		Radiative heat flux		Resin dens. Matrix density	
Center of Gravity, $X_{CG}/D$	.24	Payload mass		PH stag. pressure		Total material density	

INSTRUMENTATION:

NOTES:

- The DS-2 aeroshells were on the failed Mars Polar Lander.
- They were to be jettisoned 5 minutes before the lander entered the Martian atmosphere. No signals from the probes were received.

15

MISSION: **GALILEO**  
PLANET: **JUPITER**

LAUNCH: **OCT 18, 1989**  
ENTRY: **DEC 7, 1995**

MISSION DESCRIPTION:

*To descend into the Jovian atmosphere, collect atmospheric data and relay to the orbiter*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial: -6.64°, Rel: -8.5°, @ 450 km	Shape	Blunt-nosed, 44.86° half-cone angle	Trim L/D (specify trim $\alpha$ )	0	Material designation	Carbon-phenolic
Inertial entry velocity	59.92 km/s	Nose radius (initial)	.222 m	Ballistic coeff. (at entry)	256 kg/m <sup>2</sup>	Thickness	14.6 cm at stagnation
Relative entry velocity	47.37 km/s	Base area (at entry)	1.26 m <sup>2</sup>	Stagnation heating rate	17,000 W/cm <sup>2</sup>	Ablating? Ejected?	Yes Yes
Velocity at peak heat (relative)	39.0 km/s	Vehicle mass	At entry: 335 kg	Integrated heat load with ablation	200,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Phenolic Carbon
Control method	Ballistic	TPS mass fraction, inc. insul.	Forebody: 45.4% Afterbody: 5%	Radiative heat flux (stag point)	17,000 W/cm <sup>2</sup> (with ablation)	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	.344? see note	Payload mass	Science 8.3%	Peak Heat stag. pressure	7.3 atm	Total material density	1450 kg/m <sup>3</sup>

INSTRUMENTATION:

- Forebody TPS: ablation recession gauges
- Afterbody TPS: thermocouples in the nylon phenolic

NOTES:

- Reported CG estimates varied widely.

16

MISSION: **ARD**  
PLANET: **EARTH**

LAUNCH: **OCT 21, 1998**  
ENTRY: **OCT 21, 1998**

MISSION DESCRIPTION:

*To undertake a complete space flight cycle for ESA, with emphasis on reentry technologies*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-2.6°	Shape	Apollo-like capsule, 33° cone	Trim L/D (specify trim $\alpha$ )	-21.2°	Material designation	Fore: Aleastrasil tiles. Aft: Norcoat 622-50FI (See note)
Inertial entry velocity	8.01 km/s	Nose radius	3.36 m	Ballistic coeff.	403 kg/m <sup>2</sup>	Thickness	Norcoat: 19mm Aleastrasil 40-65 mm
Relative entry velocity	7.54 km/s	Base area	6.15 m <sup>2</sup>	Stagnation heating rate	Max recorded temp. was 950-1050°C	Ablating? Ejected?	Yes, but low
Velocity at peak heat		Vehicle mass	2715 kg (inc. 1017 kg front heat shield)	Integrated heat load	Designed for 17,700 J/cm <sup>2</sup>	Resin mat. Matrix mat.	
Control method	RCS: 7 thrusters	TPS mass fraction, inc. insul.	23% (626 kg TPS)	Radiative heat flux	Max design 110 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	.256	Payload mass	No payload	PH stag. pressure	.22 atm	Total material density	Norcoat: 0.47 Aleastrasil: 1.65

INSTRUMENTATION:

- The capsule afterbody was instrumented with 7 surface pressure sensors, 2 thermal plugs with 2 thermocouples each on the back cover, and 4 surface-mounted copper calorimeters on the cylindrical section.
- The front cone contained 18 pressure sensors, 14 thermal plugs with 3 or 5 TC each.

NOTES:

- Aleastril: silica fibers with phenolic resin; Norcoat: cork powder and phenolic resin.
- 4 experimental Ceramic Matrix Composite (CMC) tiles and samples of Flexible External Insulation (FEI)

MISSION: **HUYGENS**  
 PLANET: **TITAN**  
 A moon of Saturn

LAUNCH: **OCT 15, 1997**  
 ENTRY: **JAN 14, 2005**

MISSION DESCRIPTION:  
*To explore the atmosphere of Titan*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	-65.4° relative -65.5° inertial	Shape	60° sphere-cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	Fore: AQ60 Aft: Prosilal
Inertial entry velocity	6.0 km/s at 1270 km	Nose radius	1.25 m	Ballistic coeff.	34.5-37.5 kg/m <sup>2</sup>	Thickness	17.4 mm at stag; 18.2 mm on flank
Relative entry velocity	6.0 km/s	Base area	5.73 m <sup>2</sup>	Stagnation heating rate	50 W/cm <sup>2</sup>	Ablating? Ejected?	Yes Yes
Velocity at peak heat	~5.1 km/s	Vehicle mass	318 kg	Integrated heat load	~40 kJ/cm <sup>2</sup>	Resin mat. Matrix mat.	Phenolic Silica fiber
Control method	Ballistic	TPS mass fraction, inc. insul.	Forebody: 25% Aft: 5.1%	Radiative heat flux	15-45 W/cm <sup>2</sup>	Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D		Payload mass	44 kg	PH stag. pressure	.1 atm	Total material density	280 kg/m <sup>3</sup>

**INSTRUMENTATION:**

- No aerothermometry
- A mass spectrometer for atmospheric composition was deployed after the heat shield was ejected.

**NOTES:**

- Huygens is a European Space Agency probe that was carried by the Cassini Saturn Orbiter.
- AQ60 silica fibers reinforced by phenolic resin

MISSION: **OREX**  
 PLANET: **EARTH**

LAUNCH: **FEB 4, 1994**  
 ENTRY: **FEB 4, 1994**

MISSION DESCRIPTION:  
*To collect information on the design of a re-entry vehicle to support Japanese unmanned space shuttle HOPE*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Relative -3.17°	Shape	50° sphere-cone	Trim L/D (specify trim $\alpha$ )	0	Material designation	Si Coated C-C for nose Ceramic tile
Inertial entry velocity	7.8 km/s	Nose radius	1.35 m	Ballistic coeff.	56 kg/m <sup>2</sup>	Thickness	4 cm
Relative entry velocity	7.43 km/s	Base area	9.08 m <sup>2</sup>	Stagnation heating rate	51 W/cm <sup>2</sup>	Ablating? Ejected?	No No
Velocity at peak heat	6.4 km/s	Vehicle mass	761 kg at entry	Integrated heat load		Resin mat. Matrix mat.	
Control method	RCS	TPS mass fraction, inc. insul.		Radiative heat flux		Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	.254	Payload mass		PH stag. Pressure	.078 atm	Total material density	1800 kg/m <sup>3</sup>

**INSTRUMENTATION:**

- Wall catalytic measurement, electrostatic probe, and heat shield temperature sensors

**NOTES:**

- RCS was used to maintain a trim angle of attack of zero

MISSION: **PATHFINDER**  
**“SOJOURNER”**  
 PLANET: **MARS**

LAUNCH: DEC 4, 1996  
 ENTRY: JUL 4, 1997

MISSION DESCRIPTION:

*To demonstrate a simple, low-cost system for placing a science payload on the surface of Mars*

MISSION: **MIRKA**  
 PLANET: **EARTH**

LAUNCH: OCT 9, 1997  
 ENTRY: OCT 23, 1997

MISSION DESCRIPTION:

*To qualify a re-entry heat-shield concept with scientific and engineering experiments conducted by German researchers*

Trajectory		Geometry		Aero/thermal		TPS	
Entry angle	Inertial -14.06°	Shape	70° sphere-cone	Ballistic (0° average)	Material designation	SLA-561V (SLA-561S-backshell)	
Inertial entry velocity	7.26 km/s	Nose radius	0.66 m	At peak heat flux: 62.3 kg/m <sup>2</sup>	Thickness	1.9 cm	
Relative entry velocity	7.48 km/s	Base area	5.52 m <sup>2</sup>	105.87 W/cm <sup>2</sup>	Ablating? Ejected?	Ablating	
Velocity at peak heat	Relative: 6.61 km/s	Vehicle mass	At entry: 585.3 kg	3864.5 J/cm <sup>2</sup>	Resin mat. Matrix mat.	Resin	
Control method	Ballistic	TPS mass fraction, inc. insul.	6.2% fore body; 2% back shell	5.26 W/cm <sup>2</sup>	Resin dens. Matrix density		
Center of Gravity, X <sub>CG</sub> /D	.27	Payload mass		.19 atm	Total material density	256.45 kg/m <sup>3</sup>	

INSTRUMENTATION:

- TPS instrumented with thermocouples only

NOTES:

- Spin stabilized

Inertial entry velocity	Separation velocity: 7.3 km/s	Nose radius	.5 m	Ballistic coeff.	214 kg/m <sup>3</sup>	Thickness	Front: 3 cm Back: 2 cm
Relative entry Velocity	7.6 km/s @ 120 km	Base area	.785 m <sup>2</sup>	Stagnation heating rate	Peak: 120 W/cm <sup>2</sup>	Ablating? Ejected?	Yes No
Velocity at peak heat	6.51 km/s	Vehicle mass	154 kg	Integrated heat load	12,000 J/cm <sup>2</sup>	Resin mat. Matrix mat.	
Control method	Ballistic	TPS mass fraction, inc. insul.	36%	Radiative heat flux		Resin dens. Matrix density	
Center of Gravity, X <sub>CG</sub> /D	.4584, (y: -.0002 z: .0002)	Payload mass		PH stag. pressure	.178 atm	Total material density	Ving. Ablator: 550 kg/m <sup>3</sup>

INSTRUMENTATION:

- 3 acceleration sensors, 3 angular rate sensors, 24 thermocouples, RAFLEX (pressure, temperature & heat flux sensors) and PYREX (pyrometric temperature measurements)

NOTES:

- CFRP: Carbon Fiber Reinforced Plastics
- SPA: Surface Protected Ablator
- This was the first successful Western European re-entry mission.
